Software Development 1

8 February 2018

Agile methodology is a method of organizing the software you work on. It is primarily team based, and is designed to work quicker than waterfall. Certain amounts of work are separated into certain time slots. If the amount of work assigned is not completed within these time slots, then everything must be reworked to figure out what needs to be developed first. A high amount of customer involvement is required for Agile methodology to work at its best. In comparison, the waterfall methodology approaches the development from a linear perspective. Each step is usually done in order, moving onto the next step after one is complete. However, if a problem arises in one step, one can go back to previous steps to try to find the solution to the problem. It is overall a slower pace than Agile methodology, but could be seen as more efficient.
